Module 9 Assignment: De-Risking the Portfolio—Final Project 

1. De-Risking Strategy for Initiative 1: Conversational AI
2. De-Risking Strategy for Initiative 2: Agentic AI
3. De-Risking Strategy for Initiative 3: Emotionally Intelligent AI
4. Strategic Insight: Executive Takeaway
5. References

De-Risking Strategy 1: Conversational AI

Experience Goal:

Replace rigid data-entry forms with a conversational "Moving Persona Quiz" led by Laszlo to instantly generate a personalized moving roadmap.

Top 3 Risk Assumptions

1. **User Need Fit:** Users prefer a conversational chat interface over a traditional form and will not abandon the onboarding flow due to "chat fatigue."
2. **Capability Fit:** The Natural Language Understanding (NLU) engine can accurately extract all necessary logistical data (dates, pets, budget) without the constraints of structured form fields.
3. **Business Value:** A conversational onboarding flow will significantly lower the barrier to entry and directly increase freemium user activation.

Testing, Validation, and Evidence

Selected Testing Methods: A/B Testing & Continuous Monitoring.

Validation Focus & Evidence Needed:

Targeted A/B Testing: Conduct a split-traffic comparison between the conversational quiz (Variant A) and the legacy web form (Variant B). We have established a **Minimum Detectable Effect (MDE)** of 10%, the specific performance required to offset the quiz's increased operational complexity and cost. A full rollout will only be triggered if Variant A demonstrates this ROI threshold.

Monitoring: Track NLU drop-offs, clarification loops, and latency to ensure the chat experience does not degrade UX over time.

Because Conversational AI is a Horizon 1 initiative, we are ready to test it in live production. Our primary risk is that users might actually prefer the speed of a standard form over chatting with Laszlo, even though Laszlo can demonstrate his insights into the process. To validate this, we will run a disciplined A/B test on live traffic. We will not look at feature-level clicks, but rather the product-level metric (MDE) of overall onboarding completion rates to ensure this feature actually drives business value and is worth the cost to **ready**.

De-Risking Strategy 2: Agentic AI

Experience Goal:

Deploy a multi-agent team to autonomously source, compare, and book moving companies, synthesizing unstructured vendor quotes into a standardized matrix while keeping the human in the loop for final financial approval.

Top 3 Risk Assumptions

1. **Ecosystem Fit:** Third-party moving vendors will actively respond to AI-generated email RFQs in a timely manner.
2. **Capability Fit:** The agentic workflow can accurately extract hidden fees and insurance details from unstructured PDFs without hallucinating or omitting critical data.
3. **User Need Fit:** Users will trust an AI's comparison matrix enough to make a high-cost booking decision without calling vendors to verify.

Testing, Validation, and Evidence

Selected Testing Methods: Pilot Programs & Continuous Monitoring.

Validation Focus & Evidence Needed:

Pilot Program: Run a time-boxed (120 day) live trial with a limited user group to prove the Quote Analysis Agent extracts pricing with 99% accuracy across real vendor communications (emails, PDFs, etc.).

Monitoring: Establish guardrails to monitor inter-agent hand-offs and track the rate of human-in-the-loop escalations to ensure the system can scale without crashing.

Agentic AI introduces third-party ecosystem risks. Even if our AI works perfectly, the initiative fails if local moving companies ignore our automated emails. We cannot A/B test this blindly. We must run a controlled pilot program to measure vendor response rates and prove our data extraction is 99% accurate before scaling, as hallucinated pricing would destroy user trust.

De-Risking Strategy 2: Agentic AI

Experience Goal:

Analyze user text cues to probabilistically detect emotional states across the moving journey, dynamically adapting Laszlo's tone and task prioritization to de-escalate stress.

Top 3 Risk Assumptions

1. **User Need Fit (The Chilling Effect):** Users will find proactive emotional validation helpful rather than feeling subject to invasive "emotional surveillance."
2. **Capability Fit (Algorithmic Bias):** The emotion-detection model will not misinterpret cultural text norms or direct communication styles as "panic" or "aggression."
3. **Business Value:** Dynamic deprioritization of tasks to reduce cognitive load will not inadvertently cause users to miss critical logistical deadlines.

Testing, Validation, and Evidence

Selected Testing Methods: Lean Experiments (Interactive Prototype) & Sandbox TEVV

Validation Focus & Evidence Needed:

Interactive Prototyping: Deploy a functional prototype powered by mindful to a closed, testing group to gather qualitative "vibe checks" and track real-time interactions and thumbs-down corrections before scaling

Constraint & Sandbox Protocol: We will voluntarily adopt the EU AI Act's "high-risk" classification as an internal best practice, keeping this Horizon 3 initiative entirely sandboxed before adopting a rigorous Test, Evaluation, Verification, and Validation (TEVV) and red-teaming development process through the initiative lifecycle

For our Horizon 3 Emotion AI initiative, we need to know how users react to real artificial empathy. We are going to run an Interactive Prototyping Test where a closed group interacts with the actual, functional AI model to gauge if it triggers a chilling effect. We are treating the EU AI Act's 'high-risk' designation as an internal ethical best practice. We will keep this feature entirely in our R&D sandbox until we can implement formal TEVV and red-teaming protocols to ensure safety and mitigate algorithmic bias.

Strategic Insight: Executive Takeaway

ready. will use Gartner's **Run, Grow, Transform (RGT)** model is a portfolio allocation framework. **Run** spend keeps current operations reliable and secures the revenue floor; **Grow** spend extends today's core business into adjacent areas for compounding revenue; and **Transform** spend represents speculative bets on new business models and markets.

Experience Goal	Executive Takeaway	⚠️ Top 3 Risk Assumptions	Methods	Validation Focus & Evidence
 Run: Conversational AI	It protects our revenue floor by removing friction from our existing onboarding process.	1. User "chat fatigue" 2. NLU data extraction failure 3. Lack of freemium activation lift	A/B Testing & Continuous Monitoring	Minimum Detectable Effect (MDE) of 10%; establish post-launch guardrails tracking NLU drop-offs to ensure UX stability.
 Grow: Agentic AI	Extends our platform into a new transactional model. Interactions with third-party vendors must use a controlled pilot to prove accuracy before scaling.	1. Vendors ignore AI emails 2. AI hallucinates pricing/fees 3. Users lack trust to book	120-Day Time-boxed Pilot Program & Continuous Monitoring	Evidence of 99% data extraction accuracy; measure exact vendor response rates and human-in-the-loop escalations before scaling.
 Transform: Emotionally Intelligent AI	Horizon 3 moonshot that fundamentally changes how users interact with <i>ready.</i> technology.	1. The "Chilling Effect" (surveillance) 2. Algorithmic cultural bias 3. Perception of emotional manipulation	Interactive Alpha Testing & Sandbox-to-TEVV Pipeline	Qualitative "vibe checks" and real-time correction data; rely on sandbox red-teaming to prove ethical compliance prior to public launch.
